Abstract

We present here the bathymetric map of a new underwater volcano which began its growth on October 10th, 2011 to the south of El Hierro Island (Canary Is., Spain). The map scale is 1:25,000 and covers 21090 Ha. In July 2011, the seismic monitoring network of National Geographic Institute (IGN), began to detect an increase of low-intensity earthquakes in El Hierro Island along with ground deformation. This seismic crisis culminated on October 10th with a submarine eruption 2 km south of the small port of La Restinga, and lasted until March 2012 when IGN determined the end of the eruption process. After eight surveys monitoring the morphological and bathymetric evolution during the eruptive phase that ended in March 2012, Spanish Oceanographic Institute and the Hydrographic Institute of the Navy, carried out a survey from the 6th to the 8th of December 2012 to map the bathymetric and morphologic situation after the 2011-2012 eruptive period.
